Annual Report
October 1, 1978 - September 30, 1979

Economic Botany Laboratory
Plant Genetics and Germplasm Institute
Science and Education Administration
United States Department of Agriculture
Beltsville, Maryland 20705

Procurement of Samples for General Screening: A total of 1,751 three-pound samples were sent to RALTECH for preparation of extracts; they were from Arizona, Australia, Baja California, Brazil, California, China, Ecuador, Ghana, India, Jamaica, Kenya, Malaysia, Maryland, Mexico, Nevada, North Carolina, Oregon, Pakistan, Panama, Peru, Puerto Rico, South Africa, and Virginia.

Procurement of Confirmed Actives: 52 species of confirmed-active plants and special requests were accessioned and are listed on the attachments. The samples were from Australia, California, Costa Rica, Ghana, India, Jamaica, Kenya, Papua-New Guinea, Peru, Puerto Rico, New Zealand, Sri Lanka, and Thailand. Total weight was 11,429.75 pounds (excluding the super collections), of which 29% represented high-priority plants, 67% represented medium-priority plants, and 4% represented low-priority plants and special requests.

Distribution of Re-collections

	<u>No. of Samples</u>	<u>Total Wt. (lb)</u>	<u>Average Weight/Samples</u>
Dr. Ash	1	203.50	203.50
Dr. Cassady	23	3,905.75	169.82
Dr. Cole	1	564.00	564.00
Dr. Farnsworth	21	2,773.25	132.06
Dr. Gordon	7	785.00	112.14
Dr. Pettit	8	971.50	121.44
Dr. Powell	1	154.00	154.00
Dr. Sainsbury	1	210.50	210.50
Dr. Wall	8	1,862.25	232.78
TOTAL:	71	11,429.75	211.14

Procurement of Plant Material as Sources of Chemical Agents for Preclinical and/or Clinical Evaluation: 6,352 pounds of Heliotropium indicum were received from Ghana and sent to Dr. Boettner.

Harvesting of 20,800 Cephalotaxus harringtonia plants was begun in Oregon.

Other Activities: Small-scale field plantings of Tripterygium wilfordii were continued at the Glenn Dale U.S. Plant Introduction Station and at the Savannah U.S. Plant Introduction Station. A small experimental planting of Brucea antidysenterica was continued by Mr. A. J. W. Monkhouse of Brook Bond Liebig Kenya Ltd. in Kericho, Kenya. Maintenance of 500 plants of Maytenus buchananii was continued in Kenya.

The propagation of selected species for distribution and/or increase was continued at Glenn Dale. These species include Baccharis megapotamica, Brucea antidysenterica, Cephalotaxus harringtonia, Colchicum speciosum, Colubrina texensis, Maytenus buchananii, Putterlickia verrucosa, Taxus brevifolia and Tripterygium wilfordii.

EBL supplied germplasm of 16 species in 13 genera to NCI Contractors conducting tissue culture investigations. Dr. James P. Kutney received seedlings or rooted cuttings of Baccharis megapotamica, Brucea antidysenterica, Maytenus buchananii, Putterlickia verrucosa and Tripterygium wilfordii. Dr. Kutney also received seeds of Ba. megapotamica, Br. antidysenterica, Br. guineensis, M. buchananii, M. rothiana, and Taxus baccata. Dr. Masanara Misawa received seedlings, rooted cuttings or plants of Ba. megapotamica, Br. antidysenterica, Colchicum speciosum, M. buchananii, P. verrucosa, Ta. brevifolia and Tr. wilfordii. Dr. Misawa also received seeds of Ba. megapotamica, Br. antidysenterica, Br. guineensis, Caesalpinia gilliesii, Co. speciosum, Fagara zanthoxyloides, Heliotropium indicum, Holocantha emoryi, M. rothiana, Ochrosia coccinea, Ta. baccata, Ta. brevifolia, Thalictrum dasycarpum, and Tr. wilfordii.

EBL botanists conducted field work for general samples and re-collections in Puerto Rico, the Western U.S. and Mexico, Brazil, and in rain forest areas of Panama and Ecuador. U.S.D.A. imposed travel ceilings seriously hampered the planning and undertaking of field work by EBL botanists during the reporting period.

Steps have been taken to reduce the duplication of samples submitted for preliminary anticancer screening. This effort has resulted in a list of genera extensively screened or completed (GESOC), which has been combined with a computer generated list of species screened six or more times with no activity and/or species with confirmed anticancer activity, small samples of which are no longer wanted. With few exceptions, we will no longer accept samples of GESOC genera or samples of any of the six plus or active species. We refer to this negative compilation as the SLOP (species low on priority) list.

The SLOP list has been incorporated as an appendix to our "Agreement for Procurement of Plant Samples for General Screening" which is used as a basis for setting up purchase orders with subcontractors. This list, which eliminates an estimated 67,000 species, makes the collecting of general samples much more selective and costly and, additionally, requires the participation of a knowledgeable local botanist.

Floristic and phytogeographic studies were initiated on areas targeted for collection by EBL botanists to avoid duplication of general samples and to assure a high yield of genera and species new to the program.

Review and correction, as necessary, of the identification and nomenclature of plants previously screened was continued with emphasis on genera containing confirmed-active species.

Detailed studies on the distribution and abundance of high- and medium-priority confirmed actives were continued as a basis for collection.

EBL continued to maintain logs of materials shipped to the Sponsor's designated screening and fractionating facilities.

EBL continued to submit quarterly progress reports and monthly budget reports.

HIGH PRIORITY
